

This environment pack is designed for the **Universal Render Pipeline (URP)**

1. How to Set Up URP in Your Project

1. Install URP (if not yet installed)

- Go to `Window → Package Manager`
- Find and install the **Universal RP** package

2. Assign the URP Render Pipeline Asset

- Go to:
`Edit → Project Settings → Graphics`
- In the field **Scriptable Render Pipeline Settings**, assign:
→ `Assets/Toon Biomes Pack/Settings/URP-Balanced.asset`

3. Set URP for All Quality Levels

- Go to:
`Edit → Project Settings → Quality`
- For **each quality level** (Performant, Balanced, HighFidelity), do the following:
 - Select the level
 - In the **Rendering → Render Pipeline Asset** field, assign the appropriate asset:

Performant → Assets/Toon Biomes Pack/Settings/URP-Performant.asset

Balanced → Assets/Toon Biomes Pack/Settings/URP-Balanced.asset

High Fidelity → Assets/Toon Biomes Pack/Settings/URP-HighFidelity.asset

> *Note: The included **water shader works only in Play Mode** due to realtime depth rendering limitations in Scene View*

2. UnlitWater Shader

- **Depth Color** – color of shallow water (near the shore or on low depth).
- **Water Color** – color of deep water.
- **Visible Depth** – distance (in meters) at which the water color transitions from *Depth Color* to *Water Color*.
- **Water Outline Color** – color of shoreline foam or water edge.
- **Surface Noise** – grayscale texture used for wave distortion and foam details on the water surface.
- **Lock Tiling to World Space** – locks texture tiling to world coordinates, preventing distortion when moving objects.
- **World Tile Size (m)** – defines 1 unit in world space for tiling (usually 1 meter if your tiles are 1×1).

- **World Tiling Scale** – scales the surface noise pattern when using world tiling (higher = larger pattern, lower = finer detail).
- **Scroll Speed (uv/s)** – speed of surface noise animation (UV movement per second, simulates water motion).
- **Water Outline Max / Min** – controls the appearance range of shoreline foam:
Min – where foam starts;
Max – where it fades out. The difference defines the thickness and softness of the foam edge.
- **Render Queue** – rendering order (3000 = Transparent; keep this for correct transparency rendering).
- **Enable GPU Instancing** – enable if you're using many water tiles with the same material (improves performance).
- **Double Sided Global Illumination** – not needed for Unlit shaders; only affects baked GI for double-sided meshes.

3. CustomWaterfall Shader

♦ Static Texture

- **Tiling / Offset** – controls tiling and UV offset of the static background texture (non-animated).
- **Static Bottom Color / Top Color** – vertical color gradient applied over the static texture.
- **Static Opacity (0–100)** – opacity of the static background layer.

♦ Main Texture (Layer 1)

- **Tiling / Offset** – controls how the main texture repeats and shifts across the surface.
- **Main Speed (X,Y)** – scroll speed of the texture in UV space (simulate waterfall motion).
- **Main Scroll Rotation** – rotates the UV direction of scrolling (0–360°).
- **Main Tint** – tint color applied to the main texture.
- **Main Opacity (0–100)** – transparency of this layer.

♦ Second Texture (Layer 2)

- **Tiling / Offset** – controls tiling and UV offset of the second texture layer.
- **Second Speed (X,Y)** – scroll speed of the second texture (can differ from Main for layered movement).
- **Second Scroll Rotation** – rotation angle for UV scrolling direction of the second texture.
- **Second Tint** – tint color for the second texture layer.
- **Second Opacity (0–100)** – transparency of the second layer.

♦ Alpha Mask

- **Alpha Mask (R = alpha for Main & Second)** – a black & white mask (R channel used) controlling visibility of both Main and Second textures (white = visible, black = hidden).
- **Tiling / Offset** – adjusts scale and position of the alpha mask.

4. ToonAtlasUnlit Shader

Base Map (your atlas)

Tiling / Offset – controls how the texture atlas is tiled and positioned on the mesh.
Useful when using UV-mapped tiles or modular assets.

Base Tint

Applies a color tint over the entire texture (multiplied with the base map).
Set to white for no tinting.

Lighting Controls

Shadow Strength – simulates shadow contrast (1 = full shadow, 0 = no shadow).

Ambient Strength – controls brightness from ambient light (0 = no ambient, 1 = full).

Min Light Floor – sets the minimum light level (prevents areas from going fully black).

Invert Main Light Direction – flips the light direction (useful for fixing shading on mirrored UVs or stylized setups).
